#### **ABSTRACT**

Ethical governance is grounded in moral values. In today's context—marked by rising corruption and declining public trust—identifying the consequences, influencing factors, and ethical dimensions of ethical governance has become an unavoidable necessity. The purpose of the present study is to identify the consequences, influencing factors, and ethical dimensions and components of ethical governance using a meta-synthesis approach. The research method in this study is qualitative, and through meta-synthesis, the researcher analyzes the results and findings of previous studies. By implementing the seven-step method proposed by Sandelowski and Barroso, the research process was completed. The software used in this study was SPSS 19. The findings indicate that ethical governance includes 82 components categorized into seven main dimensions: (1) ethical leadership and competence, (2) participation and social interaction, (3) justice and fairness, (4) responsibility and accountability, (5) institutional structure and rule of law, (6) human development and welfare, and (7) fundamental and moral values. In addition, 21 influencing factors on ethical governance were identified across five main categories: socio-cultural factors, leadership and managerial factors, political and governmental factors, structural and institutional factors, and innovative and technological factors. The consequences of ethical governance encompassed 19 factors, grouped into four dimensions: economic dynamism and growth, economic integrity and transparency, work ethic and service orientation, and sustainable development and societal resilience. This study presents a comprehensive model that maps the relationships among these dimensions and consequences, as well as the factors influencing ethical governance, thereby providing a framework for the establishment of ethical governance.

Keywords: governance, ethics, ethical governance, meta-synthesis.

## Introduction

Ethical governance has emerged as a key response to contemporary crises of corruption, institutional distrust, and technological disruption in both public and private sectors worldwide (1, 2). While the classical good governance agenda emphasized procedural integrity, regulatory quality, and democratic accountability, newer discourses foreground the ethical content of decision-making, the moral character of leaders, and the value-laden nature of policy choices in complex, data-driven and globalized societies (3, 4). Ethical governance, in this sense, goes beyond compliance with formal rules to encompass justice, transparency, responsibility toward vulnerable groups, and stewardship of emerging technologies and shared resources (5, 6). In contexts marked by entrenched

corruption and low institutional trust, neglect of ethical governance can entrench a "vicious circle" in which weak institutions, corrupt practices, and social cynicism reinforce one another (1, 7).

A growing body of empirical work demonstrates that ethical or "good" governance is strongly associated with macro- and micro-level outcomes such as economic growth, social development, human welfare, and subjective well-being (3, 8, 9). Studies in the Western Balkans, South Sumatra, and other regional blocs show that internal control systems, transparency mechanisms, and rule-based administration support higher-quality financial reporting and better development trajectories (4, 10, 11). Research on OPEC+ economies similarly indicates that dimensions of good governance play a significant role in sustainable development performance (9). At the meso level, investigations of local governments and sectoral administrations reveal that ethical governance correlates with improved service delivery, greater citizen satisfaction, and higher trust in public institutions (12-14). These findings collectively suggest that ethical governance is not a normative luxury but a crucial driver of economic and social resilience (11, 15).

The technological and digital transformation of governance has simultaneously created new opportunities and risks for embedding ethical principles in institutional practice. E-government initiatives in Pakistan, Indonesia, and other emerging economies illustrate how digital platforms can streamline public administration, enhance transparency, and create pathways toward more ethical and responsive governance arrangements (16, 17). Datadriven public management and predictive analytics have been used to improve decision-making quality, optimize resource allocation, and anticipate social needs, but they also raise concerns about algorithmic bias, opacity, and accountability gaps (1, 18). Research on digital medicine, robotics, artificial intelligence, and synthetic biology underscores the necessity of robust ethical governance frameworks to protect human autonomy, prevent harm, and maintain public trust in high-stakes technological systems (5, 19-21).

In the biomedical and data-intensive research domains, new institutional models of ethics governance are being tested and debated. Studies of research ethics committees in Canada, New Zealand, China, and other settings highlight tensions between bureaucratic audit cultures and more substantive, dialogical forms of ethical deliberation (22-24). Analyses of the Menlo Report and similar initiatives show how ethics governance evolves through attempts to interpret broad values such as respect, justice, and beneficence in technologically dynamic fields (25). At the same time, scholarship warns that ethics governance can drift toward "ethical imperialism" or performative compliance, in which formalized procedures are emphasized at the expense of genuine moral responsibility and contextual judgment (26). Biobank governance and the integration of electronic health records further demonstrate the importance of consent, privacy, confidentiality, and equitable benefit-sharing as core elements of ethical governance in health-related infrastructures (19, 27).

Parallel to these global developments, there is a rich and distinctive line of work that grounds ethical governance in Islamic political thought and scriptural sources. Studies based on Nahj al-Balagha, Farabi's civil philosophy, and Qur'anic principles conceptualize ethical governance as the realization of justice, protection of human dignity, rejection of despotism, and promotion of collective welfare under divine sovereignty (28-31). These frameworks emphasize virtues such as moderation, honesty, compassion, accountability before God and community, and meritocratic appointment of officials (7, 32, 33). They also highlight the moral formation of leaders and citizens as a precondition for just and sustainable governance arrangements, moving beyond purely structural or procedural conceptions (34, 35).

Within this Islamic and Iranian context, several empirical and theoretical studies have begun to identify specific components, indicators, and domains of ethical governance in organizations and public institutions. Research in Iranian governmental bodies has mapped dimensions such as corruption control, political stability, rule of law, accountability, planning, and citizen participation as core elements of ethical governance architecture (36). Other work has explored ethical governance in Parliament, proposing transparency models that integrate financial disclosure, information accessibility, and oversight mechanisms with moral expectations of legislators (37). Studies on public welfare governance and social functions underscore the role of distributive justice, social protection, and ethical policy implementation in shaping citizens' perceptions of fairness and legitimacy (38, 39). Still others examine how ethnic diversity, cultural pluralism, and social capital can be harnessed to design more inclusive and just governance frameworks at national and local levels (39, 40).

Leadership has consistently been identified as a central mechanism through which ethical governance is enacted or undermined. Empirical research in governmental organizations shows that ethical leadership—characterized by integrity, fairness, role clarity, and responsible power-sharing—strengthens good governance practices and institutional credibility (41, 42). Strategic and traditional leadership roles in African local government and customary structures have also been shown to influence the promotion of ethical norms, responsiveness, and anti-corruption efforts (13, 43). Transformational leadership behaviors contribute to the internalization of ethical standards among public servants and can help translate formal governance principles into day-to-day administrative conduct (42, 44). At the micro level of the classroom, research on professors' ethical governance identifies domains such as respect, agency, authenticity, and practical commitment as important for shaping students' moral development and trust in academic institutions (23, 45).

Alongside leadership, a range of structural, social, and cultural factors have been shown to affect the quality of ethical governance. Studies on political tolerance and the functions of justice in Islamic political thought emphasize that resisting authoritarian tendencies, avoiding concentration of power, and institutionalizing mechanisms for checking injustice are preconditions for ethical governance (29, 46). Research on civil society, social accountability, and community participation highlights how citizen engagement, public scrutiny, and societal norms can constrain corrupt practices and strengthen ethical standards in local and national governance (2, 44, 47). Empirical work linking corruption perceptions, governance indicators, and institutional trust in various regions confirms that ethical governance underpins both public confidence in authorities and broader social cohesion (1, 14).

Digitalization and Al-driven transformations intensify the demands placed on ethical governance frameworks. The expansion of Al in defense, digital medicine, and data economy ecosystems has prompted calls for clear principles, participatory rule-making, and robust accountability mechanisms to guide the design and deployment of these technologies (19, 48, 49). Work on Al-augmented commons governance proposes models in which ethical rulemaking, participatory legislation, and context-sensitive enforcement support sustainable resource management and protect vulnerable rural communities (50). Similarly, studies of digital transformation in public financial management argue that accounting digitalization, data mining for anti–money laundering, and budget transparency can enhance financial integrity—but only when embedded within good governance and explicit ethical standards (11, 51, 52). Research on happiness, welfare, and subjective well-being further indicates that technical quality, regulatory effectiveness, and ethical governance collectively shape citizens' perceptions of life satisfaction and trust in institutions (3, 53).

Despite these rich and diverse contributions, the literature on ethical governance remains fragmented across disciplines, sectors, and normative traditions. Studies often focus either on macro-level governance indicators, sector-specific applications (such as biobanking, AI, or e-government), or context-specific religious and cultural frameworks without systematically integrating these strands into a unified conceptual model (18, 21, 22, 27). Moreover, many investigations examine either antecedents (such as leadership, digitalization, or social accountability) or outcomes (such as trust, economic growth, and sustainable development), but few offer a comprehensive synthesis of how antecedent conditions, ethical dimensions, and consequences interrelate across different governance levels (6, 8, 9, 12). Emerging frameworks in Islamic, African, and Asian contexts point to the importance of contextually grounded ethical vocabularies, yet there is still limited cross-fertilization between these perspectives and global debates on AI ethics, data governance, and transnational regulatory regimes (5, 7, 33, 54).

These gaps highlight the need for systematic synthesis of existing qualitative and conceptual studies to clarify the core ethical dimensions of governance, the key factors that promote or hinder them, and the range of individual, institutional, and societal outcomes they engender. Meta-synthetic approaches are particularly well suited to integrate diverse empirical contexts—from Iranian governmental organizations and Islamic ethical treatises to Al governance cases, research ethics regimes, and local government reforms—into a coherent, multi-dimensional model (25, 26, 28). By drawing together prior work on leadership, social and ethical functions, institutional design, digital transformation, and sectoral applications, such a synthesis can offer both a theoretically grounded and practically relevant framework for implementing ethical governance in contemporary societies (13, 34, 36, 39, 55).

Therefore, the aim of the present study is to conduct a meta-synthesis of existing research in order to identify and integrate the ethical components, influencing factors, and consequences of ethical governance.

#### **Methods and Materials**

In the present study, the researcher seeks to identify the consequences, influencing factors, and dimensions and components of ethical governance using the meta-synthesis method. Meta-synthesis involves analyzing the findings of previous studies. In other words, meta-synthesis focuses on qualitative studies that do not necessarily encompass extensive theoretical foundations and, instead of providing a collective summary of findings, produces an interpretive integration of the results. To achieve the objective of the article—namely identifying the consequences, influencing factors, and the dimensions and components of ethical governance through meta-synthesis—the seven-step method proposed by Sandelowski and Barroso (2007) was employed. A summary of these steps is shown in Figure 1.

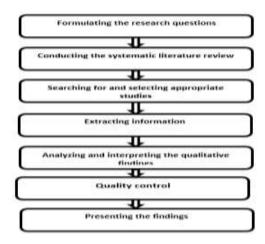

Figure 1. The seven-step method of Sandelowski and Barroso, representing the systematic process of gathering prior literature.

# **Findings and Results**

The research findings are presented below through seven steps.

## **Step One: Formulating the Research Questions**

For this section, a four-question algorithm was used. Table 1 presents four questions related to the influencing factors, outcomes, and constituent elements of ethical governance, organized into the four parts of what, who, when, and how the study is conducted.

**Table 1. Research Questions** 

Row	Four-Question Algorithm	Four-Question Algorithm for the Study
1	What – What is the meta-synthesis study designed to identify?	What influencing factors, consequences, and components are related to ethical governance?
2	Who – What is the study population?	In this study, the population includes credible books and scientific articles in Persian and English.
3	When – What is the time span of the study?	The study covers the years 2010 to 2025 (Gregorian Calendar) and 1390 to 1404 (Solar Hijri).
4	How – What is the method of conducting the study?	Data collection is based on the analysis of prior research articles.

## **Step Two: Systematic Review of Texts**

In this stage, the researcher systematically searches for published articles and studies in various reputable domestic and international scientific journals, as well as general sources and websites of credible organizations, with the aim of identifying authentic, reliable, and relevant documents within the appropriate time span. First, relevant keywords are selected. These keywords are listed in Table 2.

Table 2. Research Keywords

Row	English Keywords	Persian Keywords
1	Ethics - Moral	- اخلاق
2	Moral Governance, Ethics Governance	حكمر انى اخلاقى

Next, using search engines and reputable databases, articles, dissertations, and texts containing relevant English and Persian keywords were searched. The keywords used in search engines and academic databases are shown in Table 3.

To conduct this process, previous studies on ethical governance were examined across several domestic and international databases.

Table 3. Databases Reviewed in the Field of Ethical Governance

Туре	Databases

www.emeraldinsight.com	

## Step Three: Searching and Selecting Relevant Texts

The purpose of this step is to eliminate articles whose findings the researcher does not consider reliable; therefore, an article that might otherwise be included in the synthesis may be excluded. Based on consultation with experts (university faculty and specialists), the sources identified in the previous stage were reviewed step-by-step according to acceptance or rejection criteria.

In this step, the researcher collected suitable articles and rejected a number of them during each review cycle; these rejected articles were not examined further in the meta-synthesis process. The selected studies were reviewed multiple times, and at each stage, articles and texts not aligned with the research topic were removed. In the present study, the review process is summarized in Figure 2.

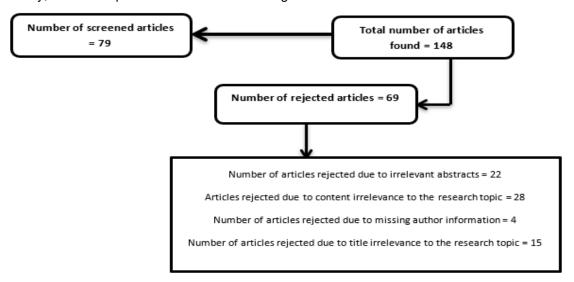

Figure 2. Review process for selecting desired articles.

In this stage, of the 148 articles reviewed, 79 articles were approved and 69 were excluded due to irrelevance.

## Step Four: Extracting Information from Texts

Extracting research findings involves classifying article information based on the reference details of each article, including the author(s), country, article title, and year of publication. In this stage, the final articles were analyzed using content analysis. The results obtained from this stage are presented in Table 4.

## Step Five: Analysis and Integration of the Identified Factors

After removing duplicate factors from the set of reviewed articles, 82 components for ethical governance, 19 factors affected by ethical governance, and 21 factors influencing ethical governance were identified. In this study, open coding was used to analyze and integrate the qualitative findings. For this purpose, all factors extracted from the studies were initially treated as open codes. Then, considering the meaning of each code, they were grouped under similar concepts. In this way, the concepts (themes) of the study were formed. In the tables below, the factors and outcomes are briefly presented.

**Table 7. Components and Dimensions of Ethical Governance** 

Row	Dimensions Extracted from Articles	Researcher's Classification (Dimensions)
1	Transparency	Dimension of institutional structure and rule of law
2	Political stability	Dimension of institutional structure and rule of law
3	Justice orientation	Dimension of justice and fairness
4	Corruption control	Dimension of institutional structure and rule of law

12	Public satisfaction	Sustainable development and societal resilience
13	Economic sustainability	Sustainable development and societal resilience
14	Environmental sustainability	Sustainable development and societal resilience
15	Economic development	Economic dynamism and growth
16	Social responsibility	Work ethic and service provision
17	Competitive advantage	Economic dynamism and growth
18	Corruption control	Integrity and transparency of the economic system
19	Poverty reduction	Sustainable development and societal resilience

# **Table 9. Factors Influencing Ethical Governance**

Row	Extracted Factors	Researcher's Classification
1	Political patience	Political and governmental factors
2	Transparency	Structural and institutional factors
3	Social functions	Socio-cultural factors
4	Legitimacy	Structural and institutional factors
5	Ethical leadership	Leadership and managerial factors
6	Attention to ethnic diversity	Socio-cultural factors
7	Islamic ethics	Socio-cultural factors
8	Justice	Socio-cultural factors
9	Avoidance of despotism	Political and governmental factors
10	Moderate behavior	Socio-cultural factors
11	Digital transformation	Innovative and technological factors
12	Strategic leadership	Leadership and managerial factors
13	Social accountability	Socio-cultural factors
14	Optimal decision-making	Leadership and managerial factors
15	Anti–money laundering efforts	Structural and institutional factors
16	Transformational leadership	Leadership and managerial factors
17	E-government	Innovative and technological factors
18	Corruption	Political and governmental factors
19	Internal control system	Structural and institutional factors
20	Quality of financial reporting	Structural and institutional factors
21	Civil society	Socio-cultural factors

**Step Six: Quality Control** 

In this study, to validate the extracted concepts from the reviewed studies, the researchers compared their assessments with those of another expert (holding a PhD in Public Administration and specializing in organizational behavior). The data obtained were analyzed using SPSS 19 to calculate Cohen's Kappa coefficient.

Table 10. Kappa Coefficient Calculations for Influencing and Affected Factors of Ethical Governance

Index	Value	Approx. Standard Error	Approx. t-value	Approx. Significance
Kappa measurement	1.000	0.000	4.895	0.000
Number of valid cases	40 factors	0	_	

**Table 11. Kappa Coefficient Calculations for Dimensions of Ethical Governance** 

Index	Value	Approx. Standard Error	Approx. t-value	Approx. Significance
Kappa measurement	1.000	0.000	8.392	0.000
Number of valid cases	82 factors	0	_	<u> </u>

The results show that the Kappa coefficient for the influencing and affected factors of ethical governance equals 1.000, and for its dimensions also equals 1.000. According to the table below, this value indicates an excellent level of agreement.

## Step Seven: Presentation of Results

**a)** After the final review, 82 components related to ethical governance were identified and categorized into seven dimensions. These are presented in the diagram below.

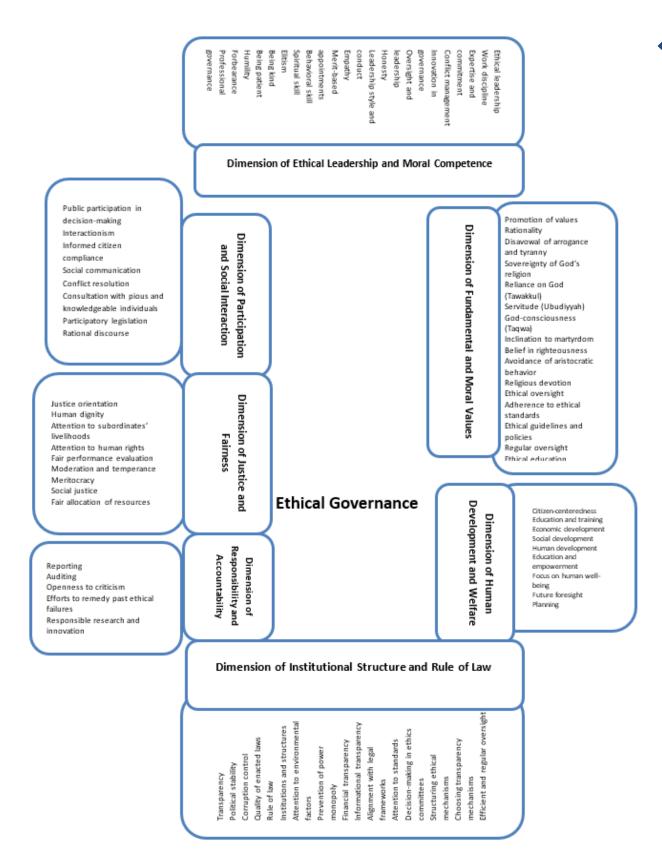

Figure 3. Dimensions and Components of Ethical Governance

**b)** After the final review, 21 influencing factors on ethical governance were identified and categorized into five dimensions. These are presented in the diagram below.

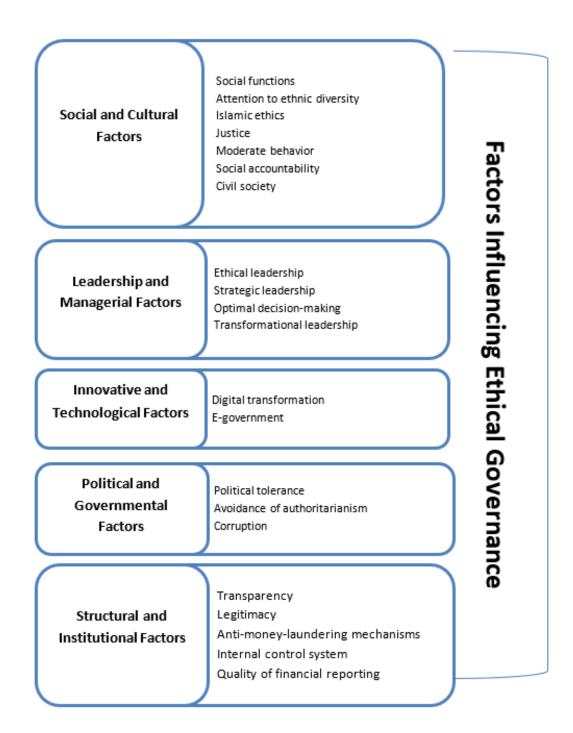

Figure 4. Factors Influencing Ethical Governance

**c)** After the final review, 19 outcomes (affected factors) of ethical governance were identified and categorized into four dimensions. These are presented in the diagram below.

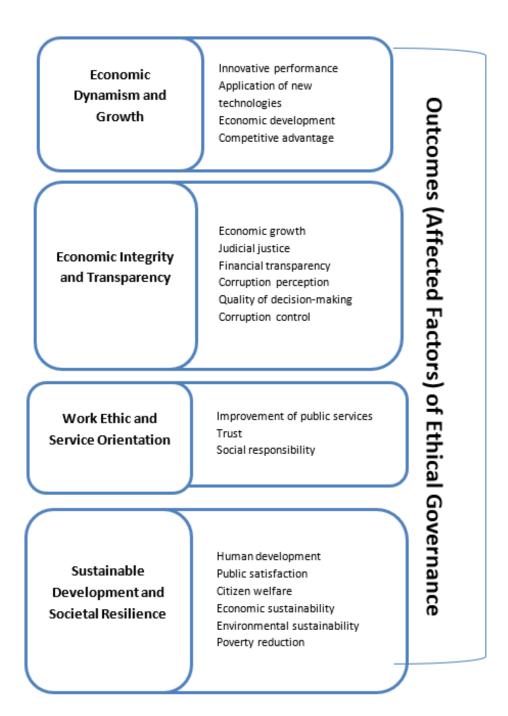

Figure 5. Factors Affected by Ethical Governance

## **Discussion and Conclusion**

The purpose of this study was to synthesize the existing body of qualitative and conceptual scholarship on ethical governance in order to identify its core components, the major antecedent factors influencing it, and the key societal and institutional outcomes it produces. The findings reveal 82 components, 21 influencing factors, and 19 affected outcomes, organized into a multidimensional model. This section discusses each set of results and situates them within the broader literature, demonstrating consistency with and divergence from prior research as represented in the reference corpus.

The results show that ethical governance is constituted by a comprehensive set of normative, managerial, structural, participatory, and developmental components. These include transparency, political stability, justice orientation, corruption control, participatory decision-making, ethical leadership, responsible reporting, merit-based appointments, public empathy, rational discourse, effective oversight, and commitment to human dignity. These findings closely align with earlier structural models of ethical governance in Iranian governmental institutions, which similarly emphasized corruption control, quality of laws, and participatory structures as key pillars (36). The prominence of ethical leadership patterns—including honesty, humility, fairness, conflict management, and responsible power-sharing—reinforces the argument made in studies on ethical leadership in governmental organizations that leadership constitutes the most actionable mechanism for embedding ethical governance in daily administrative practice (41). Parallel results in Palestinian public institutions further emphasize that transformational leadership contributes significantly to internalizing ethical standards among civil servants (42).

The results also confirm the central importance of moral and religious values—such as God-consciousness, rejection of arrogance, avoidance of authoritarianism, and emphasis on justice—as foundational dimensions of ethical governance. These findings resonate strongly with Islamic governance studies grounded in Nahj al-Balagha and Qur'anic thought, which conceptualize ethical governance not merely as a technical procedure but as a moral and spiritual responsibility (28, 31, 32). The emphasis on moderation, empathy, humility, and consultative behavior closely reflects the qualities associated with ethical rulers in Islamic political thought (29, 33). These components show that ethical governance—particularly in socio-religious contexts—must be grounded not only in institutional design but also in moral formation and ethical character development.

A further major component identified is the need for robust institutional mechanisms such as clear rules, effective oversight, transparency structures, and accountable reporting systems. This aligns with the international literature on research ethics governance, where transparency, rulemaking, and institutional clarity are essential to preventing epistemic injustice and procedural arbitrariness (22, 24). Comparable findings in biobank governance highlight the importance of informed consent, confidentiality safeguards, and ethically accountable oversight systems (27). In the field of AI and robotics, transparency and traceability are similarly emphasized as critical safeguards to ensure responsibility and prevent algorithmic harm (5, 48). The convergence across governance domains—public administration, research ethics, digital systems, and biomedicine—suggests that transparency and accountability constitute universal ethical governance components.

The influencing factors identified in this study—including political tolerance, civil society participation, legitimacy, social functions, transformational leadership, digital transformation, and anti-money-laundering mechanisms—support the findings of multiple empirical studies across different regions. For example, political tolerance as a factor reflects earlier theoretical work on justice and anti-authoritarianism in Islamic ethical governance (46). The role of transparency and financial reporting quality echoes findings in digital accounting and public financial management studies in Jordan and the European Union, which showed that digital transformation and budget transparency significantly enhance the ethical quality of governance systems (11, 51). The relevance of transformational and strategic leadership in shaping ethical governance outcomes is consistent with African studies emphasizing leadership as a catalyst for institutional integrity and ethical conduct (43, 44).

Digital transformation—one of the strongest influencing factors—mirrors global findings showing that e-government initiatives enhance procedural integrity, reduce corruption opportunities, and increase access to transparent information (16, 17). This supports the argument that ethical governance is increasingly inseparable

from technological capacity. At the same time, digitalization poses risks, particularly in sectors employing artificial intelligence. Studies on AI governance stress the necessity of participatory rulemaking, clear accountability pathways, and community-centered data ownership to ensure ethical outcomes (6, 18, 50). These results confirm that ethical governance in the twenty-first century must incorporate not only human-centered leadership principles but also technologically aware and forward-looking frameworks.

Civil society and social accountability were also identified as key influencing factors. These findings reflect prior empirical work showing that community participation, public scrutiny, and societal engagement reduce corruption and strengthen legitimacy (2, 47). Studies in African municipalities and Indonesian contexts similarly conclude that ethical governance emerges through ongoing interaction between state and society, not solely through top-down institutional reforms (13, 55). This confirms the multi-actor nature of ethical governance.

Turning to the *outcomes*, the study found that ethical governance contributes to innovative performance, economic growth, financial transparency, judicial justice, reduced corruption, improved public services, human development, citizen welfare, national trust, public satisfaction, and socioeconomic sustainability. These results mirror strong empirical evidence showing that good governance indicators are closely tied to economic growth, trust, and sustainable development in Pakistan, OPEC+ countries, and Western Balkan states (8-10). Digitalization studies further demonstrate that good governance contributes to more robust anti-money-laundering performance and reduced systemic corruption (52).

Trust emerges as a particularly significant outcome, reflecting prior cross-national studies showing that ethical governance directly strengthens institutional trust and reduces public cynicism (2, 14). The improvement of public service performance as an outcome is consistent with research conducted in Indonesia demonstrating that ethical governance enhances decision-making quality, service orientation, and accountability in public organizations (15, 55). The identification of sustainability and environmental responsibility as outcomes of ethical governance confirms findings in broader research showing that ethical decision-making fosters long-term ecological responsibility and intergenerational equity (12, 47).

The results also reveal strong connections between ethical governance and the integrity of economic systems. Financial transparency, reduction of corruption perception, higher quality financial reporting, and improved AML outcomes all align with findings in studies of digital transformation in accounting and internal control systems (4, 51, 52). These results suggest that ethical governance not only reflects moral considerations but also functions as a determinant of economic stability and systemic resilience.

The integration of results shows that ethical governance is a multilayered construct, shaped by socio-cultural, institutional, political, technological, and leadership dynamics. These factors interact to influence a comprehensive set of moral, administrative, developmental, and participatory components. Their interaction, in turn, produces societal and institutional outcomes that encompass economic, social, technological, and civic dimensions. The synthesis demonstrates the value of meta-analytic approaches in identifying systemic patterns across highly diverse research traditions—from Islamic humanities and public administration to digital governance, international ethics, and biomedical innovation.

Overall, the discussion confirms that ethical governance is not simply an administrative ideal but a practical, empirically validated framework that enhances human well-being, institutional trust, and sustainable development across diverse national and sectoral contexts (6, 21, 33). These findings affirm the necessity of embedding ethical considerations into governance design, leadership practices, digital innovation, and societal engagement.

This study, while comprehensive, is limited by the qualitative and interpretive nature of meta-synthesis. Although the selected studies span diverse geographic and institutional contexts, some regions and sectors remain underrepresented, potentially constraining global generalizability. The analysis also depends on the quality and depth of prior publications, meaning that conceptual biases or methodological inconsistencies present in earlier studies may indirectly influence the synthesized findings. Additionally, because governance paradigms evolve rapidly—especially in technologically advanced sectors—the immediacy of emerging issues such as generative AI, algorithmic regulation, and data sovereignty may surpass what current literature captures. Lastly, the synthesis focuses on published materials, excluding unpublished dissertations or gray literature that might contain relevant insights.

Future research should empirically validate the synthesized ethical governance model through multi-country comparative studies and quantitative structural modeling. Scholars should explore ethical governance mechanisms in rapidly evolving technological environments, especially in generative AI, cyber-security governance, and high-risk automated decision systems. Further studies should examine the lived experiences of public sector employees, citizens, and vulnerable groups to understand how ethical governance is enacted or obstructed in practice. Longitudinal research could track the impact of ethical governance reforms over time, while experimental and simulation-based studies could test causal pathways between influencing factors and governance outcomes. Integrating indigenous, religious, and culturally specific ethical frameworks with universal governance principles would also enrich theoretical diversity.

Organizations should embed ethical governance into leadership development programs, institutional policies, and digital transformation strategies. Decision-makers should design transparent oversight systems, strengthen internal controls, and foster cultures that reward ethical behavior. Public institutions can enhance citizen trust by improving service quality, sharing information openly, and enabling participatory decision-making. Technological deployments, especially in AI and data-driven systems, should incorporate ethical guidelines, risk assessments, and human-centered accountability structures. Strengthening social accountability mechanisms, empowering civil society, and maintaining continual ethics education can help sustain ethical governance across organizational and societal levels.

## **Acknowledgments**

We would like to express our appreciation and gratitude to all those who helped us carrying out this study.

## **Authors' Contributions**

All authors equally contributed to this study.

## **Declaration of Interest**

The authors of this article declared no conflict of interest.

## **Ethical Considerations**

All ethical principles were adheried in conducting and writing this article.

## **Transparency of Data**

In accordance with the principles of transparency and open research, we declare that all data and materials used in this study are available upon request.

### **Funding**

This research was carried out independently with personal funding and without the financial support of any governmental or private institution or organization.
